AI Integration & Product Development — Handover Playbook

(A repeatable framework for AI adoption across the organisation)

Date: 17.07.2026

Prepared For: GVW

Prepared By: Lysa Solutions

Table of Contents

1. AI Use Case Identification & Prioritization Framework
2. Documentation Required for Each Use Case
3. Team Structure & Governance Setup
4. Build Strategy: Choosing the Right Development Approach
5. End to End Product Development Overview
6. Security & Guardrails
7. Governance Framework
8. Usage & Adoption Metrics
9. 6 Month AI Roadmap
10. Summary Framework

1. AI Use Case Identification & Prioritization Framework

1.1 Collecting Use Cases

Departments should submit use cases with clear problem statements, expected outcomes, and data sources.

1.2 Evaluation Criteria

Each use case must be assessed using the following factors:

- **Data Availability** Confirm whether the required data exists, is accessible, and is usable.
- **Management Priority** Validate alignment with leadership goals and business impact.
- **Third-Party Software Dependency** If an existing external tool already solves the problem, deprioritize the use case.
- **Feasibility & ROI** Estimate development effort, cost, and expected return.
- **Operational Readiness** Ensure teams are prepared to adopt and maintain the solution.

Outcome

Use cases that score highest across these criteria should be shortlisted for development.

2. Documentation Required for Each Use Case

Annexure 1: List of Required Documents

3. Team Structure & Governance Setup

3.1 Core Roles

Product Owner

- Owns product vision
- Defines what needs to be built
- Prioritizes features
- Aligns stakeholders

Project Manager

- Plans schedules
- Manages risks
- Coordinates teams
- Tracks milestones

Engineering Team

- AI/ML engineer
- Backend developer
- Frontend developer
- QA engineer
- DevOps engineer

3.2 Project Setup

Every use case should be created as a project in:

- **ClickUp**
- **Azure Boards**
- **GitHub**

Upload BRD, FRD, and FPE. Create sprints, tasks, and milestones.

4. Build Strategy: Choosing the Right Development Approach

4.1 Low-Code / No-Code Options

Use low-code tools when possible:

- **Power Automate** Best for workflows connecting Microsoft apps.
- **Copilot Studio** Best for chatbots, Q&A systems, and knowledge retrieval.

4.2 Full-Code Development

Choose full-code development when:

- Business logic is complex
- Integrations are non-Microsoft
- Scalability or customization is required

This ensures long-term flexibility and performance.

5. End-to-End Product Development Overview

5.1 Architecture & Design

- High-level system architecture
- AI architecture (RAG, prompt flows, model selection)
- Data flow diagrams
- Integration flow
- Deployment model

5.2 Development Lifecycle

- Sprint planning
- Backend + frontend development
- AI pipeline development
- Integration with internal systems
- CI/CD setup
- QA & UAT cycles

5.3 Deployment & Handover

- Production deployment
- Monitoring setup
- Logging & alerts
- Release notes
- Admin & user training

6. Security & Guardrails

6.1 Data Security

- No PII exposure to external models
- Data masking
- Role-based access control
- Encryption in transit & at rest

6.2 AI Guardrails

- Prompt filtering
- Output validation
- Hallucination reduction
- Rate limiting
- Abuse detection
- Logging of all AI interactions

6.3 Compliance

- Internal IT policy alignment
- Vendor compliance (Microsoft, Azure)
- Audit trails
- Model versioning

7. Governance Framework

7.1 Governance Structure

- Steering committee
- Weekly project reviews
- Monthly AI roadmap reviews
- Quarterly ROI evaluation

7.2 Documentation Governance

- Version control for BRD/FRD
- Architecture documentation updates
- Release documentation
- Change management logs

7.3 AI Lifecycle Governance

- Model monitoring
- Drift detection
- Feedback loop
- Retraining schedule
- Performance dashboards

8. Usage & Adoption Metrics

8.1 Product Usage Metrics

- Daily active users
- Monthly active users
- Feature usage heatmap
- Session duration
- Drop-off points

8.2 AI Performance Metrics

- Accuracy

- Relevance score
- Hallucination rate
- Response time
- Error rate

8.3 Business Impact Metrics

- Time saved
- Cost reduction
- Productivity improvement
- SLA improvements
- Customer satisfaction

8.4 Adoption & Change Management Metrics

- Training completion
- Feedback scores
- Adoption rate per department
- Support tickets
- User satisfaction

9. 6-Month AI Roadmap

Timeline	Phase	Outcome
Month 1	Discovery + Requirements + Architecture	All foundational documents completed
Month 2	Initial Development	APIs, RAG, guardrails v1
Months 3–5	Full Development + QA + Security	Complete build + enterprise hardening
Month 6	Deployment + Monitoring + Adoption	Production rollout + user adoption

10. Summary Framework

This handover provides a repeatable AI integration framework:

Identify → Evaluate → Shortlist → Document → Form Team → Choose Build Strategy → Develop → Deploy → Secure → Govern → Measure

This framework can be applied to all future AI initiatives within the organisation.
